

Brainstorming & Ideation

Project Title

Script-Controlled ACL – Restrict Record Access Based on Field Value

Problem Identification

In ServiceNow, controlling access to records is important for protecting sensitive information. Standard role-based ACLs may not always be sufficient when access needs to depend on a specific field value in a record.

For example, students belonging to the EEE branch should be able to access EEE-related records, while records belonging to other branches should have restricted access.

Proposed Idea

The proposed project uses ServiceNow Access Control Lists (ACLs) and scripts to control access based on user roles and record field values.

The system provides separate permissions for:

READ

CREATE

WRITE

DELETE

Main Idea

The project will:

1. Create users and custom roles.
2. Create a custom Institution Details table.
3. Add student and branch information.
4. Configure ACLs for different operations.

5. Use a script to control READ access.
6. Allow administrators to retain full access.
7. Test access using different users and roles.

Expected Benefit

The project improves record security by allowing access to be controlled according to organizational requirements.
